Ultrasound imaging of the abdomen uses sound waves to produce pictures of the structures within the upper abdomen. It is used to help diagnose pain or distention (enlargement) and evaluate the kidneys, liver, gallbladder, bile ducts, pancreas, spleen and abdominal aorta. Ultrasound is safe, noninvasive and does not use ionizing radiation.

Ultrasound transducers are usually made of thin discs of an artificial ceramic material such as lead zirconate titanate. The thickness (usually 0.1–1 mm) determines the ultrasound frequency. The basic design of a plain transducer is shown in Fig. 1.1. In most diagnostic applications, ultrasound is emitted in extremely short pulses as
